Official baselines: four tasks, four independent reward scales

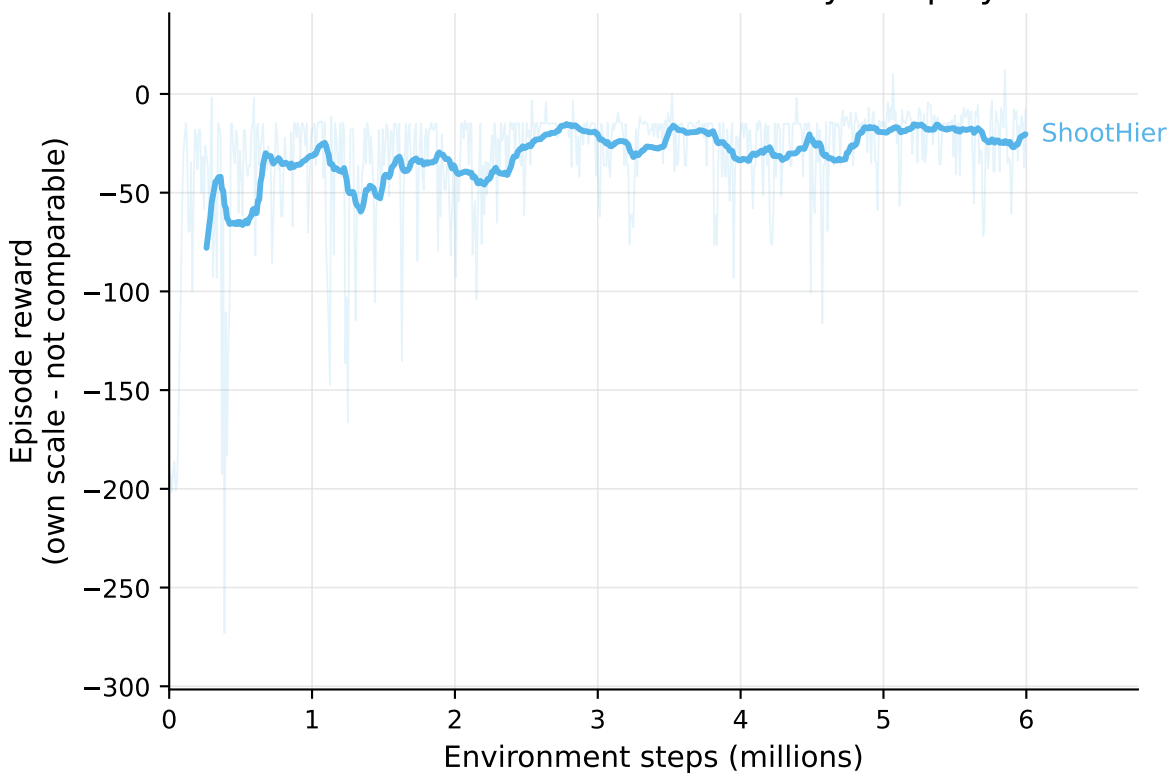

A. SingleControl - heading control (single agent)

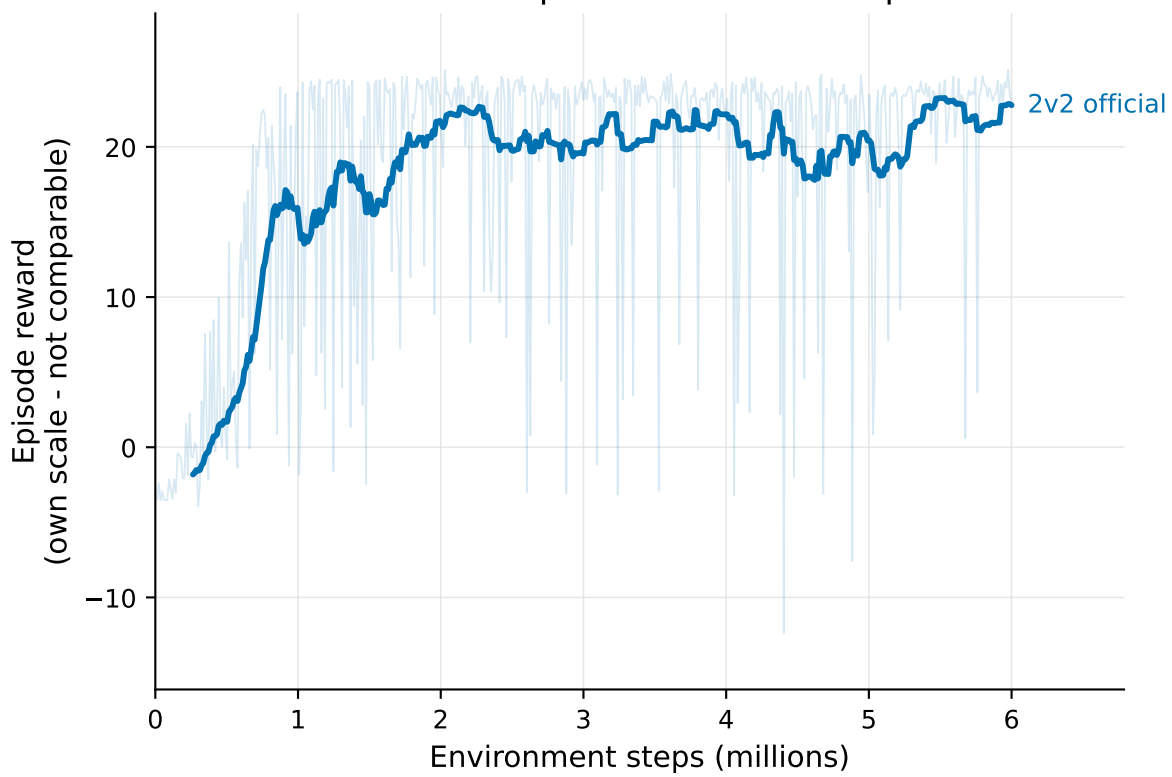

B. 1v1 NoWeapon - three training scenarios

C. 1v1 ShootMissile - hierarchy self-play

D. 2v2 MultipleCombat - NoWeapon

Official repo configs (SingleControl / 1v1 / 2v2) replicated at a reduced 6M-step budget per run; official runs use 1e8 steps, so this is a budget cut, not full convergence.
Panels carry independent y axes: task reward scales differ by an order of magnitude (heading ~+/-320, 1v1 ~+/-200, 2v2 ~+/-40, measured here), so panel levels must not be compared.
Panel B shows three 1v1 scenarios (Selfplay / vsBaseline / HierarchySelfplay), not three seeds: same colour, line style separates them.
The shaded band is the longest span whose 250k-step rolling median reward stays negative (2.5M-4.8M steps); the arrow marks its lowest episode.
Raw episode reward (lw 0.7, alpha 0.15) plus a rolling mean over a fixed 250,000-env-step window (data.DEFAULT_WINDOW).
Runs end at 5,994,000 steps (1v1, 3 threads, time cap) or 6,000,000 (heading and 2v2, 4 threads).
