

NoWeapon HierarchySelfplay; 6M env steps target, 5 of 8 runs reached it - the rest stop at their last logged step (see end labels). Seeds per panel: 2v2=1, 3v3=2, 5v5=3, 10v10=2.
Rolling mean over a fixed 250,000-env-step window (raw curves beneath: lw 0.7, alpha 0.15). Line style = seed (solid 0, dashed 1, dash-dot 2).
n_rollout_threads differ by size (2v2=4, 3v3=8, 5v5=8 for seeds 0/2 and 10 for seed 1, 10v10=20), so cross-size gaps mix batch size with scale.
Each panel has its own y-scale: heights are NOT comparable across panels (2v2 spans -5..+23, 10v10 -18..+17; the tasks' reward definitions differ); rare raw spikes are clipped by the panel limits.
